

Sampling distribution	Bootstrap distribution
Select samples of size n from the population. Calculate the sample statistic, plot it on a dotplot.	Select samples of size n from the sample itself, with replacement. Calculate the bootstrap statistic and plot it on a dotplot.
Assume sample size is “large enough”.	Assume sample size is “large enough”.
Center: At the population parameter	Center: At the sample statistic
Assume sample size is “large enough”.	Assume sample size is “large enough”.
Shape: Bell-shaped (mound-shaped), symmetric	Shape: Bell-shaped (mound-shaped), symmetric
Spread: More about this another day, but for now – standard deviation of the sampling distribution (the standard error) has roughly the same value as the standard deviation for the bootstrap distribution.	Spread: More about this another day, but for now – standard deviation of the sampling distribution (the standard error) has roughly the same value as the standard deviation for the bootstrap distribution.
