

Height and Weight - Part 1

MATH 213

Group 1

1. Put your scatterplot of weight versus height in the space to the right.
2. Describe the scatterplot, writing in context and thinking about:
 - Shape (linear or otherwise)
 - Direction (positive or negative association)
 - Strength of association (weak, moderate, strong?)

Remember to use GEE!

3. Use the drawing tools above to add a line to the graph you pasted on the previous slide that you think captures the overall trend in the data. The tool you are looking for has this icon: 

Your goal is for your line to pass through the center of the collection of dots as much as possible. The line does not necessarily have to pass through any of the individual data points!

4. Next, find the equation (slope-intercept form) of your line by hand. Do your work on paper and report your equation below.

5. Once you have found the equation of your line, go back to Posit Cloud and add another geom to your scatterplot to check your work. You can use `+geom_abline(slope = ___, intercept = ___)`, where you replace the blanks with the slope and intercept that you found. If you are not happy with the way your line looks, please check your calculations and try again.

6. When you are happy with your line, report the slope and intercept in the [shared spreadsheet here](#). We will look at everyone's results together.
