

StatKey for Sex Discrimination study

We will perform a randomization test to check how unusual the experimental difference of proportions of $21/24 - 14/24 = 0.29$ would be if we assume that the sex associated with the file had no effect on the supervisors' decisions.

https://www.lock5stat.com/StatKey/randomization_2_cat/randomization_2_cat.html

Go to randomization test for difference of proportions

Click on Edit Data

Group 1 count = 21

Group 1 sample size = 24

Group 2 count = 14

Group 2 sample size = 24

Click on "Generate 1000 samples".

How unusual does the experimental result of 0.29 seem? Quantify that by producing a probability of getting a result as or more extreme than this value.
